

What are the business benefits of compressed air efficiency?

Despite the fact that they are essential for many businesses, compressed air systems are often ignored until something goes wrong with them, or the compressors fail to keep up with rising air demand. Compressed air systems use up to 10% of total industrial electricity use in Australia, so it makes sense to look at their energy cost.

Energy efficiency will also increase the proportion of compressed air that is used for production and minimize unnecessary wastage, again resulting in significant cost savings.
